                                                                                                                                                                                                                                                                                                                                                                                                        Treating glomerulonephritis with antibody against complement C5 component - to inhibit complement induced cell lysis Claim 38; Page 123-125; 181pp; English.

A DNA construct (708483) codes for a humanised CDR-grafted and framework sequence-altered Fd 5G1.1 VH + IGHRL (R77610), which includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1.

The DNA can be subcloned together with DNA (708484) coding for a humanised light chain (R77612) into vector APEX-3P (708476) for expression of humanised antibody in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAb 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with Sequence 750 BP; 163 A; 220 C; 197 G; 170 T;

A DNA construct (1708487) codes for a humanised CDR-grafted light chain, designated 5G1.1 VI + IGHRLD (R77615), which includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. The DNA can be subcloned together with DNA (1708484) coding for a humanised FG (R77611) into vector APEX-3P (T00476) for expression of humanised antibody in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAD 5G1.1 to block

A DNA construct (108483) codes for a humanised CDR-grafted and framework sequence-altered Fd 5G1.1 VH + IGHRL (R77610), which includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. The DNA can be subcloned together with DNA (708484) coding for a humanised light chain (R77612) into vector APEX-3P (T08476) for expression of humanised antibody in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAD 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with

                                                                                                                                                                Treating glomerulonephritis with antibody against complement C5 component - to inhibit complement induced cell lysis Claim 42; Page 129-131; 181pp; English.

A DNA construct (T10706) codes for a humanised CDR-grafted and framework sequence-altered light chain, 5G11 VL + KLV56B (R77613), which includes CDRs derived from mouse anti-C5 monoclonal antibody which includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. The DNA can be subcloned together with DNA (T08483) coding for a humanised Fd (R77610) into vector APEX-3P (T08476) for expression of humanised antibody in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAb 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09-NOV-1995.

Treating glomerulonephritis with antibody against complement C5 recomponent to inhibit complement induced cell lysis component to inhibit complement induced cell lysis?

Claim 35; Page 132-34; 181pp; English.

A DNA construct (T08486) codes for a humanised CDR-grafted light chain, designated 5G1.1 VL + 012 (R77614), which includes colls derived from mouse anti-C5 monoclonal antibody 5G1.1 The DNA can be subcloned together with DNA (T08484) coding for a humanised fd (R77611) into vector APEX-3P (T08476) for expression of humanised antibody in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAb 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis.

A DNA construct (108485) codes for a humanised CDR-grafted and framework sequence-altered light chain, 561.1 VL + KLV56 (R77612), which includes CDRs derived from mouse anti-C5 monoclonal antibody for a humanised FG (R77610) into vector APEX-3P (T08483) coding for a humanised antibody in human 293 EBNA cells. Such human complement C5a generation and thus to reduce glomerular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New multivalent antigen-binding proteins - comprise Fv fragment linked to at least 1 other Fv fragment spacer and useful for in-vivo diagnosis or therapy
Example; Fig 5 34pp; English.

Example; Fig 5 34pp; English.

The bivalent antigen-binding protein B72.3 Fv (R20184) is an example of the antigen-binding proteins of the invention. They comprise a first Fv fragment bound to at least one other Fv fragment by a linker which keeps the Fv fragment apart. The connecting structure of R20184 comprises a joining sequence derived from a human IgG1 domain linked to a complete human IgG4 hinge region. R20185 is the sequence of the shortened hinge version of the B72.3 single chain Fv
                                                                                                                                                                                                                                                                                                                                                                                                 AGCCTGAAGACTTCGCTACGTATTACTGTCAGAACGTTTTAAATACTCCGTTGACTTTCG

PR Analogues of type I ribosome inactivating protein - useful as protein cytotoxic agents, immuno toxins for treating auto immune diseases, pr cytotoxic agents, immuno toxins for treating auto immune diseases, pr cancer, graft versus host disease and selective cell killing in-vivo PS Example 12; Page 123-124; 163pp; English.

CC A single chain antibody form of the has H5 variable domain was casembled from previously constructed genes. This scab segment compared in the entire V and J segment of the other (light or Cheavy) via a 15 amino acid flexible peptide. The scab was assembled con two orientations (see 042284 and 042285). A fusion construct was prepared in which the natural sequence gelonin gene was positioned controlled the N-terminus and the SLT or RMA linker peptide was positioned
                                                                                                                                                                                                                                                                                                                                                        V-J(kappa)/[(Gly)4Ser]37V-J(gamma) single chain antibody.

Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells
Disclosure; Page 67; 90pp; English.
Sequences 194963 to 194973 encode recombinant fusion proteins (rOnc)
which are modifications of the RNase Onconase (RTM) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or too form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also used for cell separation in vitro by selectively killing unwanted types
                                                                                                                                                                                                                                 of cells, e.g. In bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for Killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to none and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              366
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            426

Sequences T94963 to T94973 encode recombinant fusion proteins (ronc)

Which are modifications of the RNase Onconase (RTM) (nonc). Such novel

Tibonuclease molecules are highly cytotoxic and can be used alone or

to form chemical conjugates or to target recombinant immunofusions. They

are used particularly for decreasing tumour cell growth. They can also be

used for cell separation in vitro by selectively killing unwanted types

cused for cells, e.g. in bone marrow prior to transplantation into a patient

undergoing marrow ablation by radiation, or for killing leukaemia cells

or T-cells that would cause graft versus host disease. The toxins can

also be used to selectively kill unwanted cells in culture. The new

ribonucleases have increased cytotoxic activity compared to nonc and also

lower Immunogenicity in humans.

CC Sequences T94963 to T94973 encode recombinant fusion proteins (rOnc)

CC which are modifications of the RNase Onconase (RTM) (nOnc). Such novel

CC ribonuclease molecules are highly cytotoxic and can be used alone or

CC to form chemical conjugates or to target recombinant immunofusions. They

CC are used particularly for decreasing tumour cell growth. They can also be

CC used for cell separation in vitro by selectively killing unwanted types

CC of cells, e.g. in bone marrow prior to transplantation into a patient

CC undergoing marrow ablation by radiation, or for killing leukaemia cells

CC or T-cells that would cause graft versus host disease. The toxins can

CC also be used to selectively kill unwanted cells in culture. The new

CC ribonucleases have increased cytotoxic activity compared to nonc and also

CC lower immunogenicity in humans.
